Vision Statement

My doctoral research advanced the **robustness**, **interpretability**, and **efficiency** of neural topic models by improving **representation learning**, preventing posterior collapse, and applying **knowledge distillation**. Building on this foundation, my current agenda targets two fronts for LLMs: **mechanistic interpretability**—uncovering how internal computations yield behavior—and **algorithmic scaling**—making large models more tractable and sustainable. My ultimate goal is to leverage my skills in representation learning and algorithmic design to help build LLMs that are **auditable**, **trustworthy**, and **resource-efficient**.

Short Bio

I am a Ph.D. candidate at the School of Mathematical & Computational Sciences (SMCS) in IACS, with a specialization in topic modeling for NLP. My research focuses on enhancing the quality of topic representations, improving interpretability, and increasing the efficiency of topic models, with publications in venues such as ACL 2025, NAACL 2024, EACL 2023, ECIR 2023, and IEEE Transactions on Artificial Intelligence. I will submit my doctoral thesis for review in August 2025 and am actively seeking a full-time research position in either industry or academia.
